

Assignment-5.4

Task Description #1:

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

The screenshot shows a code editor interface with a Python script named `5.4.py`. The script prompts the user for their name, age, and email, collects this information in a dictionary, and then hashes the email address using SHA-256 before storing it. A tooltip from GitHub Copilot suggests adding inline comments explaining data protection techniques.

```
5.4.py
1 # Write a python script that collects user name ,age and email
2 # using input() and stores them in a dictionary.
3 # Collect user information
4 user_info = {}
5 user_info['name'] = input("Enter your name: ")
6 user_info['age'] = input("Enter your age: ")
7 user_info['email'] = input("Enter your email: ")
8 # Display the collected information
9 print("Collected User Information:")
10 for key,value in user_info.items():
11     print(f'{key.capitalize()}: {value}')
12 # Add inline comments explaining how to protect or anonymize
13 # User data such as hashing emails ,and avoiding plain text storage.
14
15 # Function to hash email for anonymization
16 def hash_email(email):
17     # Use SHA-256 hashing algorithm to hash the email
18     return hashlib.sha256(email.encode()).hexdigest()
19 # Hash the email before storing it
20 user_info['email'] = hash_email(user_info['email'])
21 # Now the email is stored in hashed form, protecting user privacy
22 print("Anonymized User Information:")
23 for key,value in user_info.items():
24     print(f'{key.capitalize()}: {value}')
25
26
```

Ask about your code
AI responses may be inaccurate.

GitHub copilot was prompted to generate a python script that collects basic user information such as name ,age and email .
A follow -up prompt was used to add inline comments explaining data protection techniques .
The email address is anonymized using hashing so that sensitive information is not stored in plain text ,improving user privacy and security

Task Description #2:

- Ask Copilot to generate a Python function for sentiment analysis.

Then prompt Copilot to identify and handle potential biases in the data.

```
● 542ipy >
  1 #!/usr/bin/python
  2 # Write a Python function that performs basic sentiment analysis
  3 # on a given text and returns Positive, Negative, or Neutral
  4 def sentiment_analysis(text):
  5     # Define lists of positive and negative words
  6     positive_words = ['happy', 'joy', 'love', 'excellent', 'good', 'great', 'fantastic', 'positive']
  7     negative_words = ['sad', 'anger', 'hate', 'terrible', 'bad', 'awful', 'horrible', 'negative']
  8
  9     # Initialize counters for positive and negative words
 10    pos_count = 0
 11    neg_count = 0
 12
 13    # Split the text into words for analysis
 14    words = text.lower().split()
 15
 16    # Count occurrences of positive and negative words
 17    for word in words:
 18        if word in positive_words:
 19            pos_count += 1
 20        elif word in negative_words:
 21            neg_count += 1
 22
 23    # Determine sentiment based on counts
 24    if pos_count > neg_count:
 25        return "Positive"
 26    elif neg_count > pos_count:
 27        return "Negative"
 28    else:
 29        return "Neutral"
 30
 31 # Example usage
 32 text = "I love programming but sometimes it can be terrible."
 33 result = sentiment_analysis(text)
 34 print("The sentiment of the text is: " + result)
```

63
64 print("The sentiment of the filtered text is: (result)")

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS

```

Explanation:

GitHub Copilot was prompted to generate a Python function for basic sentiment analysis.

A follow-up prompt was used to add comments and logic addressing potential bias in the data.

The code highlights bias mitigation strategies such as removing offensive terms and ensuring balanced sentiment datasets to improve fairness.

Task Description #3:

- Use Copilot to write a Python program that recommends products based on user history. Ask it to follow ethical guidelines like transparency and fairness.

like transparency and fairness.

```
# 4.4d.py
1 Write a python program that recommends products to a user
2 based on their previous purchase or browsing history.
3
4 class ProductRecommender:
5     def __init__(self, user_history, product_catalog):
6         self.user_history = user_history
7         self.product_catalog = product_catalog
8
9     def recommended_products(self, num_recommendations=5):
10        # Extract categories from user history
11        categories = set()
12        for item in self.user_history:
13            categories.add(item['category'])
14
15        # Find products in the same categories
16        recommendations = []
17        for product in self.product_catalog:
18            if product['category'] in categories and product not in self.user_history:
19                recommendations.append(product)
20
21        # Sort by popularity
22        return sorted(recommendations, key=lambda x: x['num_recommendations'], reverse=True)[0:num_recommendations]
23
24 # Example user history and product catalog
25 user_history = [
26     ('Ist-1', 'name': 'Wireless Mouse', 'category': 'Electronics'),
27     ('Ist-2', 'name': 'Bluetooth Headphones', 'category': 'Electronics'),
28     ('Ist-3', 'name': 'Intra Ear', 'category': 'Fitness')
29 ]
30
31 product_catalog = [
32     ('Ist-1', 'name': 'Gaming Keyboard', 'category': 'Electronics'),
33     ('Ist-2', 'name': 'Smartphone', 'category': 'Electronics'),
34     ('Ist-3', 'name': 'Sweat Band Set', 'category': 'Fitness'),
35     ('Ist-4', 'name': 'Running Shoes', 'category': 'Fitness'),
36     ('Ist-5', 'name': 'Cookbook', 'category': 'Books'),
37     ('Ist-6', 'name': 'Novel', 'category': 'Books')
38 ]
39
40 # Create a recommender instance
41 recommender = ProductRecommender(user_history, product_catalog)
42 # Get product recommendations
43 recommendations = recommender.recommended_products()
44
45 # Print recommendations
46 for product in recommendations:
47     print(f'Recommended Product: {product["name"]} (Category: {product["category"]})')
48
49     # Add explanations to show why each product is recommended
50     # Include fairness checks to avoid favoritism toward any brand
51     # Add a timestamp to track when this recommendation was made
52     # Print a reason based on the user's interest in {product['category']} products.
53     # Explain how this recommendation can be used in this step.
54     # It's real application would online store like here
55     # and use it to refine the recommendation algorithm over time.
56
57     print("Reason: Based on your interest in {product['category']} products.")
58
59     # Please provide feedback on this recommendation to help us improve future suggestions.\n"

Explanation:

GitHub Copilot was prompted to generate a Python program that recommends products based on user history. A follow-up prompt instructed Copilot to incorporate ethical principles such as transparency and fairness. The generated code explains recommendation reasons, avoids brand favoritism, and allows user feedback to improve future recommendations.

Task Description #4:

- Prompt Copilot to generate logging functionality in a Python web application. Then, ask it to ensure the logs do not record sensitive information.

Product Recommendation System in Python - Assisted coding - Visual...

Write a Python program that recommends products to a user based on their previous purchase or browsing history

- Used 1 reference
- ✓ Read current file for context and requirements

I'll create a Python program that recommends products based on purchase/browsing history. Let me first check the current file state.

- ✓ Read 5.4(4).py

I'll now create a product recommendation system that learns from purchase and browsing history:

- ✓ Created 5.4(4).py

Now let's test the program:

- ✓ cd "C:\Users\gbsgu\OneDrive\Documents\Desktop\Assisted coding" ; python "5.4(4).py"

Let me try with the Python terminal instead:

- ✓ ● python "c:/Users/gbsgu/OneDrive/Documents/Desktop/Assisted coding/5.4(4).py" <<< "A`nLaptop`nV`nR`nB`nE" 2>&1

Let me create a test script instead:

- ✓ Created test_recommendations.py
- ✓ ● cd "C:\Users\gbsgu\OneDrive\Documents\Desktop\Assisted coding" ; python test_recommendations.py

Perfect! I've created a comprehensive product recommendation system. Here's what the program does:

Describe what to build next

The screenshot shows a Jupyter Notebook interface with the following details:

- Title Bar:** Assisted coding
- File Menu:** File, Edit, Selection, View, Go, Run, Terminal, Help
- Code Cell:** Contains Python code for a product recommendation system. The code includes imports, a main loop, user input handling, and a recommendation function.
- Output Cell:** Displays the output of the code execution, including user history, recommendations, and a product details table.
- Toolbar:** Includes icons for file operations, cell selection, and help.
- Bottom Status Bar:** Shows the current kernel (Python), memory usage (4.0 GB), and other system information.

```

Explanation:

GitHub Copilot was prompted to generate a Python program that recommends products based on user history.

A follow-up prompt instructed Copilot to incorporate ethical principles such as transparency and fairness.

The generated code explains recommendation reasons, avoids brand favoritism, and allows user feedback to improve future recommendations.

Task Description #5:

- Ask Copilot to generate a machine learning model. Then, prompt

it to add documentation on how to use the model responsibly

(e.g., explainability, accuracy limits).

The screenshot shows a Jupyter Notebook interface with the following code and output:

```
54.5.ipynb
1 # Create a simple machine learning model in python
2 # that predicts outcomes using a sample dataset
3 import sys
4 from sklearn.model_selection import train_test_split
5 from sklearn.ensemble import RandomForestClassifier
6 from sklearn.metrics import accuracy_score, classification_report
7
8 def create_sample_dataset():
9     """Create a sample dataset for prediction"""
10    # A feature set (age, income, credit_score, employment_years)
11    X = [
12        (25, 30000, 600, 2),
13        (30, 40000, 700, 3),
14        (45, 80000, 700, 15),
15        (28, 35000, 650, 3),
16        (55, 120000, 800, 20),
17        (32, 45000, 550, 1),
18        (40, 70000, 750, 10),
19        (30, 45000, 700, 4),
20    ]
21
22    # Targets: 1 = Loan Approved, 0 = Loan Denied
23    y = [1, 1, 1, 1, 0, 1, 1]
24
25    return X, y
26
27 def train_model(X_train, y_train):
28     """Train a random forest classifier"""
29     model = RandomForestClassifier(n_estimators=10, random_state=42)
30     model.fit(X_train, y_train)
31     return model
32
33 def evaluate_model(model, X_test, y_test):
34     """Evaluate model performance"""
35     predictions = model.predict(X_test)
36     accuracy = accuracy_score(y_test, predictions)

31             age, income, credit_score, employment_years = get_user_input()
32         else:
33             age, income, credit_score, employment_years = get_user_input()
34
35     # Validate inputs
36     if age < 0 or income < 0 or credit_score < 0 or employment_years < 0:
37         print("X Error: All values must be non-negative.")
38         exit(1)
39
40     prediction = model.predict([[age, income, credit_score, employment_years]])
41     result = "✓ Loan Approved" if prediction[0] == 1 else "✗ Loan Denied"
42
43     print("\nApplicant Profile:")
44     print(f"Age: {age}")
45     print(f"Income: ${income},k")
46     print(f"Credit Score: {credit_score}")
47     print(f"Employment Years: {employment_years}")
48     print(f"\nPrediction: {result}\n")
```

Below the code cell, the terminal output shows the execution of the script and the resulting applicant profile and prediction.

The screenshot shows a Jupyter Notebook environment with the following details:

- Title Bar:** File, Edit, Selection, View, Go, Run, Terminal, Help, Assisted coding.
- Code Cell:** Contains Python code for a loan approval model. The code includes imports, function definitions for prediction and user input, and a main block that creates a dataset, splits it, trains a model, and makes predictions. It also includes a section for "Important Notes" with 10 bullet points.
- Output Cell:** Shows the command run, the path to the script, and the command used to execute it.
- Execution Results:** Displays the user input (Age: 30, Income: 50000, Credit Score: 200, Employment Years: 5) and the prediction output ("Prediction: ✓ Loan Approved").
- Bottom Status Bar:** Includes icons for Python, file operations, and a search bar.

Explanation:

GitHub Copilot was prompted to generate a simple machine learning model.

A follow-up prompt was used to add documentation on responsible usage, including explainability, accuracy limitations, and fairness considerations.

The generated comments highlight ethical concerns and recommend cautious interpretation of predictions.
